Re: Clean Air Zone AG (CAZAG)

Bio-Technology for air purification for use in the Cannabis Industry

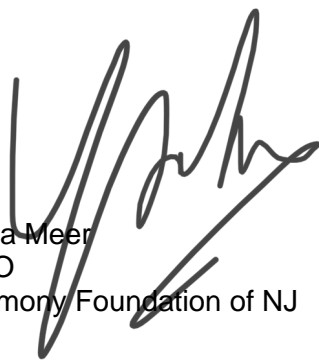

The Harmony Foundation has installed Clean Air Zone AG (CAZAG) filter less clean air technology to control airborne pollutants and biological pathogens in the forms of VOCs (Volatile Organic Compounds), particulates, mold, bacteria, and odors associated with the production of Cannabis.

We are quite pleased with the results of this filterless bio-tech approach after the mechanical systems which were installed at an earlier stage such as carbon filtration, HEPA, HVAC filters and other measures fell well short of our expectations despite a substantial investment.

This CAZAG Technology is working substantially better than just the mechanical systems that we first installed. The added benefit is that this system not only removes the above mentioned pollutants, after it captures them, it biologically digests them directly inside their bioreactors, completely consuming them.

CAZAG has been maintaining the system since its installation and is mostly hands off for the Harmony team, freeing us up to concentrate on other important tasks.

Our future plans are to continue to build out our filter less bio-tech approach with CAZAG as we grow our organization as it has proved itself superior to conventional mechanical only systems. The fact that it is a green, filter less chemical free natural solution is very attractive to us at Harmony.
